Installing Ura-Fen into Cavity

The revolution continues

- TERM-seal Termite & Damp Course Management Systems

URA-FEN MAJOR PREMIUM TERMITE BARRIER

Ura-Fen Major is a long lasting, cost competitive full block barrier for gaps, cavities and fissures in new or existing buildings to prevent and deter moisture.

The Ura-Fen Major Barrier is formed *in situ* by an exothermic reaction that expands and forces the sealant into the smallest gaps within the sub cavity.

Ura-Fen Major is the perfect solution for creating a permanent full block termite barrier below the damp course as a perimeter barrier.

Ura-Fen contains 2g/kg bifenthrin that is permanently locked into the sealant and is the active constituent that repels, kills and deters any attempt by termites to penetrate the barrier.

NO COSTLY RETREATMENTS

Ura-Fen when installed as part of a cavity perimeter system is two barriers in one.

With TERM-seal PRM Active protecting the masonry and an application of TERM-seal Multi-Purpose Active coating over the Ura-Fen, a termite barrier is formed that will last a lifetime of the building.

Ura-Fen is the perfect termite protection for monolithic, in fill or footing slabs, bearer and joist treatment, tilt panels, block-outs, large joints and gaps, penetration protection and many more useful applications.
